

Why I the rainforests!

I've been on lots of expeditions to rainforests over the years — they're filled with so much magic, from colourful frogs with big voices to bugs as long as your arm and spiders as big as your hand! But the rainforest is a place that's changed more than anywhere else I know in the last 20 years. When I first visited, there were trees as far as the eye could see, but the last time I went back, the forests were vanishing.

If you were to take all of the animals living in one rainforest tree, half of them would be unknown to science. There's more knowledge in the unknown biodiversity of the rainforests than we could ever imagine! And our planet will not be the same if we let them go.

Steve Backshall's new novel, *Ghosts of the Forest*, set in the rainforests of Borneo, is out now through Orion Children's Books.

I think rainforests are amazing! When I was little, I remember my mother taking us into one in Trinidad where I saw amazing wildlife that exists no where else on this planet. It was a very special moment for me. But now, in Sumatra, Southeast Asia, tigers are losing their rainforest habitats to palm oil plantations.

If we are to preserve these amazing habitats, we must combine our knowledge with the needs of the people who rely on the rainforests to live, so we can make a sustainable outcome for both! Rainforests are the last of the really wild places left on Earth. In the rainforest you're reminded of the power and the strength of our planet — and I love that!

Liz Bonnin, TV presenter and animal biologist, is working with Whiskas and WWF to raise awareness of a new partnership aimed at helping to protect the few remaining tigers in the wild. Turn to page 3 for more or visit whiskas.co.uk/wwf
